Reporte de Congestión Vial

Autores: Equipo de Analítica

Curso: Minería de Datos

Fecha: 21/09/2025

Introducción

Se desarrollaron etapas de limpieza, exploración, reducción de dimensionalidad y modelado predictivo con enfoque reproducible en Python.

Metodología

El conjunto analizado contiene 3520 registros y 21 variables tras el enriquecimiento.

Análisis Exploratorio (EDA)

Los resultados completos se presentan en las tablas y figuras asociadas a esta sección.

Evaluación de Normalidad

Prueba de normalidad: Shapiro-Wilk Variable: Velocidad km/h Estadístico: 0.9715 p-valor: 0.0000 n: 3520 Conclusión: Se rechaza la normalidad al 5%.

Análisis PCA

Se requieren 6 componentes (hasta PC6) para explicar al menos el 95% de la varianza.

Se evaluaron las cargas de las dos primeras componentes para interpretar patrones espaciales y temporales.

Modelo 1

Modelo lineal con todas las variables disponibles (preprocesamiento estándar y codificación one-hot).

Desempeño: RMSE: 3.722, R2: 0.294, MAE: 2.982, Bias: -0.217.

Modelo 2

Modelo lineal con selección secuencial de variables para mejorar interpretabilidad.

Desempeño: RMSE: 4.074, R2: 0.154, MAE: 3.317, Bias: -0.157.

Comparación de Modelos

Se compararon métricas clave frente a un baseline simple y se generaron gráficos diagnósticos para ambos modelos.
